

Revision of statement prepared for the Second Coordination meeting on International Migration, Population Division, Department of Economic and Social Affairs, United Nations, New York, 15-16 October 2003

by Mary M. Kritz
January 2004

As the international professional association of demographers, the IUSSP seeks to promote scientific knowledge of demographic trends and the interrelationships between these trends and economic and social development and human welfare. Through its global scientific network of almost 2000 members, the IUSSP is well positioned to carry forward this agenda. However, promoting knowledge on international migration is vastly more complicated than advancing knowledge of births or mortality because the definition of migration is largely determined by political and administrative agencies within countries and standards applied vary in accordance with country perceptions of migration trends and data needs. As such the basic facts about immigration trends, immigrant characteristics, and duration of residence of immigrants in another country are poorly known compared to demographic knowledge of fertility, mortality and internal migration.

Because of the poor quality of data on international migration, the IUSSP agenda in the field of international migration has emphasized two dimensions: (1) improvements in the quality of data on international migration; and (2) comparative study of the determinants and consequences of international migration. To carry forward that agenda, the IUSSP set up two working groups in the 1970s. The Working Group on the Methodology for the Study of International Migration (1978-1981) which promoted the inclusion of the "place of birth" question in national population censuses and recommended alternative methodologies for estimating emigration based on questions that could be included in population censuses or household survey forms. The efforts of that Working Group contributed to improvements in data measurement that were subsequently promoted by the United Nations Statistical Office. The Working Group on the Economics of International Migration (1978-1981) was set up to assess the state of the art in the field of international migration and to recommend proposals for future IUSSP activities on the subject.

The IUSSP then set up a Committee on the Economic and Social Aspects of International Migration (1982-1985) to assess two topics: the consequences of international migration for sending and receiving countries and emerging and future international migration patterns and issues that are likely to dominate the field in the future. That group concluded that theoretical propositions far outpaced empirical testing in the field of international migration and recommended that the IUSSP seek ways to advance knowledge that would build on the existing data base on international migration and simultaneously seek to improve it. To carry forward that work, the IUSSP Committee on International Migration (1985-1989) was subsequently set up and employed the case study method in its work. To improve data and measurement on international migration, that Committee organized a meeting in Ottawa, Canada, in collaboration with the U.S. Bureau of the Census and Statistics Canada at which demographic statisticians from a number of countries presented papers on their country's data gathering efforts and made recommendations for improvements. Because the Canada meeting had the sponsorship of two leading statistical agencies and included participants from the United Nations system and country statistical offices who were directly involved in the collection and dissemination of statistics on international migration, many of the recommendations from the meeting subsequently were put into practice.

The second line of work advanced by the Committee on International Migration was to clarify the operation of international migration systems, processes and policies in different world regions. The goal was to identify sending and receiving countries that were organized into coherent migration systems. The basic premise underlying the migration systems approach is that international migration does not occur randomly between countries nor is it based solely on levels and trends in economic development or gaps between countries in economic development and population growth. The Committee first identified migration systems on an empirical basis by assessing which sending and receiving countries sent disproportionate numbers of migrants to a single sending country rather than to others. Then the group examined those systems in depth in order to identify other linkages (economic, social, political, historical, geographic, and cultural) that were unique to each system. In 1987, the Committee organized an exploratory workshop on migration systems at the Center for Migration Studies, Staten Island, New York, and, in 1988, it organized a Seminar on International Migration Systems, Processes, and Policies at Genting Highlands, Malaysia, co-sponsored with the University of Malaya. These meetings enabled the Committee to assess the merits of the international migration system approach based on case studies from different regions and papers that addressed theoretical and empirical issues.

The IUSSP Committee on South to North Migration (1991-1995) then was set up to look at systematic patterns that linked sending and receiving countries into migration networks. The Committee took up the agenda of improving theoretical understanding of how international migration systems developed and continued across space and time. The South-to-North Migration Committee functioned mainly as a working group that focused on review, synthesis and publication. Attention was directed to a review and critique of theories that explain the emergence and operation of migration systems, evaluation of the merits of theories as they are able to explain flows in different world regions, and development of a coherent guide for future research and policy formation. The resulting work was published as an IUSSP/OUP volume. The Committee subsequently looked at changing patterns of international migration in the contemporary world and at policy measures utilized by sending countries to promote labor export and utilize remittances more effectively as a development tool. It also looked at measures adopted by receiving countries in response to changing international migration dynamics. A seminar on these issues was convened in Barcelona in 1997 co-sponsored by the IUSSP, the Ortega and Gasset Cultural Institute of Spain and the Government of Catalonia.

IUSSP efforts that started almost thirty years ago have now culminated in the advancement of several propositions that need further empirical testing to determine the extent to which they adequately account for trends in international migration today. These propositions include:

1. International migration does not stem from a lack of economic growth and development but from development itself;
2. Immigration is a natural consequence of broader processes of social, political and economic integration across international borders;
3. Immigrants are generally responding to a strong and persistent demand that is built into the structure of post-industrial economies;
4. Migrants who enter a developed country for the first time generally do not intend to settle permanently;
5. International migration is often less influenced by conditions in labor markets than by those in other kinds of markets;

6. As international migrants accumulate experience abroad, their motivations change, usually in ways that promote additional trips of longer duration, yielding a rising likelihood of settlement over time;
7. International migration tends to build its own infrastructure of support over time;
8. Immigrant flows do not last forever -- they have a natural life that may be longer or short but are necessarily of limited duration;

Each of the scientific groups sponsored by the IUSSP has issued publications that document their work. Presentation and dissemination of scientific findings have long been a hallmark of the IUSSP since knowledge will be best advanced as ideas become widely disseminated and subjected to rigorous empirical testing. Simultaneously with the work of its scientific groups, the IUSSP has organized an international conference every four years at which international migration trends and theoretical and empirical efforts to understand these trends have been presented. The next IUSSP International Population Conference will be held 18-23 July 2005 in Tours, France. The International Organizing Committee for that meeting has approved a record number of sessions on international migration, as follows:

1. Migration and networks
2. Migration and employment
3. Population aging, labor force and international migration
4. Migrant integration
5. International migration statistics and measurement
6. Consequences of migration on areas of origin
7. Trends of international migration flows
8. Impact of international migration policies
9. Demographic effects of international migration on receiving countries
10. Forced migration
11. Irregular migration: measurement, determinants, consequences and policy implications
12. International migration in rural areas

The IUSSP Council has agreed that a new Scientific Panel on International Migration should be set up in the 2004-2005 period to continue to push forward knowledge of international migration. While the agenda for this group remains to be determined, a logical next step would be to examine more closely the extent to which the propositions listed above hold up empirically in different world regions and to identify what types of international migration flows are growing in importance. Other issues might also be examined. For instance, relatively little attention has been given to the role of complex institutions in structuring international migration flows across countries or to the growing importance of temporary immigration policy measures. In addition, displacements of populations within and across national borders as a result of military conflict, famine, environmental deterioration, and poverty continue to raise questions regarding the extent to which countries need to keep access open to refugees and displaced persons for humanitarian purposes. The consequences of immigration for receiving countries and differentials in demographic, social and economic processes between immigrants and native-born persons offer another productive line of research.
